有一张表：emp有esal字段

--数据去重：

　　delete from emp e1 where rowid<>(select max(rowid) from emp e2 where e1.esal=e2.esal)

--分页(工资从小到大)：构架：select e.* from emp e where rownum>1 and rownum<10;

　　a.工资排序：select e.* from emp e order by e.esal

　　b.分页核心为：rownum, rownum>1 并且 rownum<11(不能直接使用)

　　c.构造rownum<11：select a.*,rownum rn from (select e.* from emp e order by e.esal) a

　　d.select b.* from (select a.*,rownum rn from (select e.* from emp_bak e order by e.sal) a where rownum < 6) b where b.rn>2;
